Table 1 18013=P13608-2; Sequence=VSP 003072;

-1- DOWAIN: Two globular domains, Gl and G2, comprise the N-terminus of the proteoglycan, while another globular region, G3, makes up the C-terminus. Gl contains Link domains and thus consists of the chee disulfide-bonded loop structures designated as the A, B, B' motifs. G2 is similar to Gl. The Keratan sulfate (KS) and the chondroitin sulfate (CS) attachment domains lie between G2 and G3.

--- PTM: Contains mostly chondroitin sulfate, but also N-linked and O-linked (about 40) oligosaccharides.

--- PTM: The keratan sulfate considerably between adult and fetal bovine proteoglycans.

--- STMILARITY: Belongs to the aggrecan/versican proteoglycan family.

--- SIMILARITY: Contains 1 C-type lectin domain.

--- SIMILARITY: Contains 1 IG-like V-type (immunoglobulin-like)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This Swiss-Prot entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation the European Bioinformatics Institute. There are no restrictions on its use as long as its content is in no way modified and this statement is not
                  -1- SIMILARITY: Contains 4 Link domains.
                                                                                                                                                                                                                                                                                                                                                                                    Event=Alternative splicing; Named isoforms=2;

Seems to function along with eIP-2 (By similarity).

SIMILARITY: Belongs to the IF-2 family.
                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       01-OCT-1996 (Rel. 34, Created)

3B9 was positive. cDNA clones of the 3B9 light and heavy chains were cloned into pGEM7f+ and transformed into E. coli DH5-alpha. A heavy chain cDNA clone was sequenced (AAQ83491) that encoded the protein given in AAR70190. 3 CDRs (AAR70198-200) were identified. (Updated on 25-MAR-2003 to correct PN field.)

```

```
New DNA molecules encoding recombinant antibodies useful for treating IL4 -mediated conditions.
                                                                                                                                                                                                                                         Heavy chain variable region; interleukin-4; IL-4; antibody 3B9; chimeric antibody; humanised antibody; IL-4 mediated allergic reaction; Immunoglobulin E-mediated allergic reaction; allergic rhinitis; conjunctivitis; atopic dermatitis; atopic asthma; anaphylactic shock; rheumatoid arthritis; host-versus-graft disease; renal disease; allergy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a complementarity determining region (CDR) of the heavy chain variable region of murine interleukin-4 (IL-4) antibody 319. The specification describes chimeric and humanised IL-4 monoclonal antibodies. The antibodies of the invention are used in therapeutic and pharmaceutical compositions for treating IL-4 mediated conjunctivitis, atopic dermatitis, atopic asthma, anaphylactic rhinitis, rheumatoid arthritis, host-versus-graft disease and renal disease. They are also useful in the diagnosis of an allergy or condition associated with excess IL-4 production through the measurement e.g. by ELISA of circulating endogenous IL-4 levels in humans
                                                                                                                                                                                                            CDR of the heavy chain variable region of antibody 3B9.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gross MS;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 3; Col 47-48; 50pp; English.

Spleen cells from mice immunized with human IL-4 were used to prepare hybridomas, which were screened for anti-IL-4 MAD secretion. Only clone

Disclosure; Page 57; 97pp; English.

Chimeric and humanised IL-4 monoclonal antibodies (mAbs), derived from high affinity mAbs - useful in treatment of IL-4-mediated and IgE-mediated allergic conditions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a heavy chain complementarity determining region (CDR) from an antibody of the invention. The antibody is a chimeric or humanised interleukin-4 (IL4) monoclonal antibody for the treatment of immunoglobulin E (IgE) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhinitis, conjunctivitis, atopic dermatitis, atopic asthma and anaphylactic shock. The antibodies are also useful for regulating B and T cell proliferation and as such are useful in the treatment of autoimmune diseases and graft versus host disease
                                                                                                                                                                                                                                                                        Antibody; interleukin-4; II4; immunoglobulin E; IgE mediated disease; allergic disorder; allergic rhinitis; conjunctivitis; atopic dermatitis; atopic asthma; anaphylactic shock; cell proliferation regulator; therapy; autoimmune disease; graft versus host disease; complementarity determining region; CDR.

                                                                                                                                                                                              The present sequence is that of complementarity determining region (CDR) 2 of the heavy chain of murine monoclonal antibody 10D5. Novel humanised antibodies of the invention have CDRs from 10D5 and human framework sequences. These humanised antibodies have binding affinities (affinity and epitope location) approximately the same as those of the mouse 10D5 antibody. The invention includes antibodies, single chain antibodies, and their fragments, as well as nucleotide sequences, vectors, transformed host cells, and methods of using the humanised antibody to treat, prevent, alleviate, reverse or otherwise ameliorate symptoms and/or pathology associated with Down's syndrome, (pre-)clinical crebral amyloid angiopathy, and to inhibit
                                                                                                                                                                                                                                                                                                                                                                                                        ö

The invention relates to at least one isolated mammalian amyloid antibody one comprising at least one variable region comprising at least one light Chain, of a fully defined sequence of SEO 10 (8):48, 58, 60, 56 70, 79 and 80, respectively. Also described are: (1) at least one isolated mammalian amyloid antibody that binds to the came relation of comprising at least one isolated mammalian amyloid antibody that binds to the batch of the comprising to the came relation of comprising at least one and sequence of SEO 100 (8):48, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134-3, 134

This invention relates to novel antibodies that bind to the G protein coupled receptor protein identified as GRR64, namely GRR64-1, GRR64-16, GRR64-18, GRR64-18, GRR64-10, and GRR64-18. Specifically, it refers to the use of these anti-GRR64 antibodies as selective cytotoxic agents against GRR64 expressing tumour cells such as those associated with ovarian cancer, uterine cancer and Ewing's sarcoma. The present invention describes epitope mapping of those antibodies that show high affinity binding to GRR64 through competitive binding analyses, such that the antibodies can be assessed for GRR64 dependent cell death in vitro. Accordingly, they can be used to develop cytostatic compositions for gene therapy or immunotherapy that inhibit cellular proliferation of an ovarian cancerous cell and furthermore can diagnose and inhibit growth of tumour cells. This polypeptide is encoded by a heavy chain variable region DNA sequence of a murine anti-human GRR64 antibody of the invention.
                                                                                                                                                                                           New antibody that inhibits binding of a GPR64 polypeptide to an antibody comprising GPR64-18, GPR64-81, GPR64-93 or GPR64-101, useful in preparing a composition for diagnosing or treating ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Light chain variable region; interleukin-4; IL-4; antibody 3B9; chimeric antibody; humanised antibody; IL-4 mediated allergic reaction; Immunoglobulin E-mediated allergic reaction; allergic rhinitis; conjunctivitis; atopic dermatitis; atopic asthma; anaphylactic shock; rheumatoid arthritis; host-versus-graft disease; renal disease; allergy; IS NEW.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100.0%; Score 95; DB 8; Length 120; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes the variable heavy and light chain regions (I) of murine monoclonal antibody (mAB) 1F7. AAY91014 to AAY91016 represent specifically claimed amino acid sequences of the variable light chain, and AAY91017 to AAY91019 represent specifically claimed amino acid sequence of the variable heavy chain. The antibodies are used for treatment of HIV (human immunodeficiency virus) infection and AIDS (acquired immunodeficiency syndrome). They are also used for detecting HIV in serum and for stimulating HIV antigen related and committed B cells to produce broadly reactive and neutralising antibodies by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Variable heavy and light chain regions of murine monoclonal antibody 1F7, useful for treating HIV infection and AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Variable heavy chain protein of murine anti-human GPR64-16 antibody ID15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        murine; mouse; antibody; GPR64; cytotoxic; ovarian cancer;

This sequence represents the heavy chain of the humanised 3B9 antibody of the invention. The antibody is a chimeric or humanised interleukin-4 (IL4) monoclonal antibody for the treatment of immunoglobulin B (IgE) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhimitis, conjunctivitis, atopic demarkitis, atopic asthma and anaphylactic shock. The antibodies are also useful for regulating B and T cell proliferation and as such are useful in the treatment of autoimmune diseases and graft versus host disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polynucleotide encoding a complementarity- or framework-determining region of an anti-idiotypic antibody that binds to human or primate antihuman immunodeficiency virus (HIV) antibodies, for use in vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to coding sequences of the murine 1F7 anti-
idiotypic antibody complementarity-determining region (CDR) or framework-
determining region (FR). The antibody binds to human or primate anti-
human immunodeficiency virus (HIV) antibodies and can be used in the
treatment of HIV infection. The present sequence is the 1F7 heavy chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mouse; 1F7; antibody; immune modulator; anti-HIV antibody; CDR; complementarity determining region; framework-determining region; FR; heavy chain; light chain; HIV infection.

                                                                                                                                                                                                                             antibodies. The antibodies of the invention are used in therapeutic and pharmaceutical compositions for treating IL-4 mediated and Immunoglobulin armaceutical compositions e.g. allergic rhinitis, conjunctivitis, atopic asthma, anaphylactic shock, rheumacoid arthritis, host-versus-graft disease and renal disease. They are also asthmitis, host-versus-graft disease and renal disease. They are also useful in the diagnosis of an allergy or condition associated with excess IL-4 production through the measurement e.g. by ELISA of circulating endogenous IL-4 levels in humans. The present sequence represents the heavy chain variable region of Ig NEW, and is used in the course of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

This invention relates to novel antibodies that bind to the G protein coupled receptor protein identified as GPR64, namely GPR64-1, GPR64-16, GPR64-18, GPR64-19, GPR64-10, GPR6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antibody that inhibits binding of a GPR64 polypeptide to an antibody comprising GPR64-18, GPR64-81, GPR64-93 or GPR64-101, useful in preparing a composition for diagnosing or treating ovarian cancer.
                                                                                                                  Variable heavy chain protein of murine anti-human GPR64-18 antibody ID17.
                                                                                                                                                                       murine; mouse; antibody; GPR64; cytotoxic; ovarian cancer;
uterine cancer; Ewing's sarcoma; cell death; cytostatic; gene therapy;
immunotherapy; cellular proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Law D, Wang Q, Dubridge R, Bhaskar V;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 2; SEQ.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     EXXXEXEXEXEX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes an isolated antibody that binds specifically to a stalk of CD30 of a cell, or to an epitope destroyed upon cleavage of soluble CD30 (sCD30) from intact CD30. Also described:

(1) a composition comprising the antibody conjugated or fused to a therapeutic part; (2) a nucleic acid encoding an antibody that binds specifically to a stalk of CD30 of a cell, or to an epitope destroyed upon cleavage of sCD30 from intact CD30; (3) an expression vector comprising the nucleic acid operably linked to a promoter; (4) inhibiting growth of a CD30+ cancer cell; (5) detecting the presence of a CD30+ cell or a biological sample; (6) a host cell expressing the isolated nucleic acid encoding the antibody having variable heavy and variable light chains; and (7) a kit for detecting the presence of a CD30+ cancer cell a biological sample comprising a container and an anti-CD30 antibody has cytostatic activity, and can be used in gene therapy. The anti-CD30 antibody that binds specifically to a stalk of therapy. The anti-CD30 antibody that binds specifically to a stalk of intact CD30 is useful for the manufacture of a medicament for inhibiting the growth of a CD30+ cancer cell. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antibody that binds specifically to a stalk of CD30 of a cell, or to an epitope destroyed upon cleavage of soluble CD30 (sCD30) from intact CD30, useful for inhibiting the growth of a CD30+ cancer cell.
                                                                                                                                                                                                                                                                                                                                        antibody; CD30; anti-CD30 antibody; cytostatic; gene therapy; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Spleen cells from mice immunized with human IL-4 were used to prepare hybridomas, which were screened for anti-IL-4 MAD secretion. Only clone 189 was positive. cDNA clones of the 189 light and heavy chains were cloned into pGEM7f+ and transformed into E. coli DH5-alpha. The clones were sequenced (AAQ89490-91), and used for antibody engineering. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Heavy chain variable region; interleukin-4; IL-4; antibody 389; chimeric antibody; humanised antibody; IL-4 mediated allergic reaction; Immunoglobulin E-mediated allergic reaction; allergic rhinitis; conjunctivitis; atopic dermattis; atopic asthma; anaphylactic shock; rhenmatoid arthritis; host-versus-graft disease; renal disease; allergy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Chimeric and humanised IL-4 monoclonal antibodies (mAbs), derived from high affinity mAbs - useful in treatment of IL-4-mediated and IgE-mediated allergic conditions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is that of a particularly preferred heavy chain variable region of a humanised antibody of the present invention. In this sequence, the complementarity determining regions originate from murine monoclonal antibody 10D5 and the framework regions originates from human germaline VH segment DP-28 and J segment JH4. Novel humanised antibodies of the invention have CDRs from 10D5 and human framework sequences. These humanised antibodies from 10D5 and human framework sequences. These humanised antibodies have binding affinities (affinity and epitope location) approximately the same as those of the mouse 10D5 antibody. The invention includes antibodies, single chain antibodies, and their fragments, as well as nucleotide sequences, vectors, transformed host cells, and methods of using the humanised antibody to treat, prevent, alleviate, reverse or otherwise ameliorate symptoms and/or pathology associated with Down's syndrome, (pre-)clinical Alzheimer's disease or (pre-)clinical cerebral amyloid anglopathy, and to inhibit formation or reduce Abeta plaque in the brain. This sequence represents the heavy chain of the murine 3B9 antibody of the invention. The antibody is a chimeric or humanised interleukin-4 (IL4) monoclonal antibody for the treatment of immunoglobulin E (IgE) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhinitis, conjunctivitis, atopic asthma and anaphylactic shock. The antibodies are also useful for regulating B and T cell proliferation and as such are useful in the treatment of autoimmune diseases and graft versus host disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents the heavy chain variable region of murine interleukin-4 (IL-4) antibody 189: The sequences are used in the production chimeric and humanised IL-4 monoclonal antibodies. The antibodies of the invention are used in therapeutic and pharmaceutical compositions for treating IL-4 mediated and Immunoglobulin E-mediated allergic reactions e.g. allergic rhinitis, conjunctivitis, atopic dermatitis, atopic athma, anaphylactic shock, rheumatoid archritis, host dermatitis, atopic archma, anaphylactic shock, rheumatoid archritis, host diagnosis of an allergy or condition associated with excess IL-4 production through the measurement e.g. by ELISA of circulating endogenous IL-4 levels in humans
                                                                                                                                                                                                                                                                                                                                                                      DNA molecules encoding recombinant antibodies useful for treating IL4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antibody, interleukin-4; IL4; immunoglobulin E; IgE mediated disease; allergic disorder; allergic rhinitis; conjunctivitis; atopic dermatitis; atopic asthma; anaphylactic shock; cell proliferation regulator; therapy; autoimmune disease; graft versus host disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                               A humanized antibody heavy chain variable region and signal sequence is given in AAR70192. The signal sequence is also provided in AAR70193. The Schwances of the construct are identical to the native CDRs of mouse anti-human IL-4 MAb 1B9 (AAR70198-200). (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                        Chimeric and humanised IL-4 monoclonal antibodies (mabs), derived from high affinity mabs - useful in treatment of IL-4-mediated and \lg E-mediated allergic conditions.

                                                                                                                                                                               A human/mouse chimeric antibody heavy chain variable region was constructed (given in AAR70191) that contained the mouse anti-human IL-4 MAD 389 variable region including 3 CDRs (AAR70198-200) and a human antibody signal peptide (AAR70193). The construct was used for humanized antibody production. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Heavy chain variable region; interleukin-4; IL-4; antibody 3B9; chimeric antibody; humanised antibody; IL-4 mediated allergic reaction; Immunoglobulin E-mediated allergic reaction; allergic rintintis; conjunctivitis; atopic dermatitis; atopic asthma; anaphylactic shock; rheumatoid arthritis; host-versus-graft disease; renal disease; allergy.
                                                                                Chimeric and humanised IL-4 monoclonal antibodies (mAbs), derived from high affinity mAbs - useful in treatment of IL-4-mediated and IgE-mediated allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                       Gaps

This sequence represents the light chain of the chimeric 3B9 antibody of the invention. The antibody is a chimeric or humanised interleukin-4 (IL4) monoclonal antibody for the treatment of immunoglobulin E (IgE) mediated diseases. The antibodies are useful for the treatment of albergic disorders such as allergic rhinitis, conjunctivitis, atopic asthma and anaphylactic shock. The antibodies are also useful for regulating B and T cell proliferation and as such are useful in the treatment of autoimmune diseases and graft versus host disease
             atopic dermatitis, atopic asthms, anaphylactic shock, rheumatoid arthritis, host-versus-graft disease and renal disease. They are also useful in the diagnosis of an allergy or condition associated with excess IL-4 production through the measurement e.g. by ELISA of circulating endogenous IL-4 levels in humans.                                                                                                                                                                                                                                                                                        ö
             The present sequence represents the heavy chain variable region of a humanised murine interleukin-4 (IL-4) antibody 389. The specification describes chimmeric and humanised IL-4 monoclonal antibodies. The antibodies of the invention are used in therapeutic and pharmaceutical compositions for treating IL-4 mediated and Immunoglobulin E-mediated allergic reactions e.g. allergic rhinitis, conjunctivitis, atopic asthma, anaphylactic shock, rheumarcid arthritis, versus-graft disease and renal disease. They are also useful in the diagnosis of an allergy or condition associated with excess IL-4 production through the measurement e.g. by ELISA of circulating endogenous IL-4 levels in humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents the heavy chain variable region of murine/human interleukin-4 (IL-4) chimeric antibody 3B9. The specification describes chimeric and humanised IL-4 monoclonal antibodies. The present invention relates to new humanized immunoglobulin (Ig) light chain (LC) or heavy chain (HC) comprising variable region complementarity determining regions from 3D6/10D5 Ig LC or HC variable region sequence, and variable framework region from human acceptor Ig LC or HC sequence. The invention is useful for preventing or treating an amyloidogenic disease or Alzheimer's disease in a patient. The invention is also useful for in vivo imaging amyloid deposits in a patient. The present amino acid sequence represents a mouse 3D6/10D5 variable light (VL) chain or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              3D6; heavy chain variable region; immunoglobulin; complementarity determining region; CDR; 10D5; variable framework region; neuroprotective; nootropic; gene therapy; amyloidogenic disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents the heavy chain of the humanised 389 antibody of the invention. The antibody is a chimeric or humanised interleukin-4 (IL4) monoclonal antibody for the treatment of immunoglobulin E (IgE) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhinitis, conjunctivitis, atopic dermartisis, atopic asthma and anaphylactic shock. The antibodies are also useful for regulating B and T cell proliferation and as such are useful in the treatment of autoimmune diseases and graft versus host disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The invention relates to a novel humanised immunoglobulin light or heavy chain. The humanised immunoglobulin light or heavy chain comprises:

variable region complementarity determining regions (CDR's) from the 3D6 immunoglobulin light chain variable region sequence of 132 amino acids fully defined in the specification (ADR88406), or heavy chain variable region sequence of 131 amino acids fully defined in the specification (ADR88408); or from the 10D5 immunoglobulin light chain variable region sequence of 131 amino acids given in the specification (ADR88418) or conservation (ADR88408); or from the 10D5 immunoglobulin light chain variable region sequence of 142 amino acids fully defined in the specification (ADR88420); and a variable framework region from a chuman acceptor immunoglobulin light or heavy chain sequence, provided that at least one framework residue is substituted with the corresponding amino acid residue from the mouse 306 or 10D5 light or heavy chain variable region sequence, where the framework residue that non-covalently binds antigen directly, a residue adjacent to a CDR, a CDR on-covalently binds antigen directly, a residue adjacent to a CDR, and may have a use in gene therapy. The composition and methods are constituted and may have a use in gene therapy. The composition and methods are constituted and moctropic activity, and may have a use in gene therapy. The composition and methods are constituted and moctropic activity, and may have a use in gene therapy of manunoglobulin, immunoglobulin, immunoglobuli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New humanized antibodies that recognize beta amyloid peptides, useful for preventing or treating amyloidogenic diseases, such as Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   chain, or its domain. The present sequence immunoglobulin heavy chain variable region.

Claim 5; SEQ ID NO 59; 306pp; English.

The invention relates to at least one isolated mammalian amyloid antibody comprising at least one variable region comprising at least one heavy chain and at least one light chain, of a fully defined sequence of SEQ ID NOS: 48, 49, 59, 60, 69, 70, 79 and 80, respectively. Also described are: (i) at least one isolated mammalian amyloid antibody that binds to the same region of an amyloid polypeptide as an antibody comprising at least one heavy chain or light chain complementarity determining region (CDR) that least one isolated mammalian amyloid antibody, comprising at least one isolated mammalian amyloid antibody, comprising at least one isolated mammalian amyloid antibody, comprising at least one solated mammalian amyloid antibody comprising at least one solated mammalian amyloid antibody comprising at least one isolated mammalian amyloid antibody comprising at least one of any of the isolated mammalian amyloid antibodic acid encoding at least one of any of the isolated mucleic acid encoding an amyloid antibody, (vi) a method of sequence of SEQ ID NO: 52, 61, 62, 71, 72, 81 and 82, (iv) an isolated mucleic acid encoding an amyloid antibody, (vi) a method of an amyloid antibody, (vi) a method of an isolated mucleic acid encoding an amyloid antibody, (vi) a method of the isolated mammalian amyloid antibodies of an isolated mucleic acid encoding an amyloid antibodies mentioned, and at least one pharmaceutical carrier or diluent, (vii) an anti-idiotype antibodies mentioned, (ix) a method of diagnosing or treadment that specifically binds at least one amyloid antibody or fragment that specifically binds at least one of the antibodies mentioned, where the device comprising at least one amyloid antibody, (vi) an article of maning and encoded and antibody or the confirming at least one amyloid antibody, (vi) an article of maning or and antibody or incomprising at least one amyloid antibody, (vi) an article of maning or and a pharmaceutical or diagnostic use, comprising packaging material and a container comprising a solution or a lyophilized form of at least one of the amyloid antibodies mentioned; and (xii) a method of producing at least one of the isolated mammalian amyloid antibodies, comprising providing a host cell or transgenic animal or transgenic plant or plant cell capable of expressing the antibody in recoverable amounts. The methods and compositions of the present invention are useful for

location) approximately the same as those of the mouse 10D5 antibody. The invention includes antibodies, single chain antibodies, and their fragments, as well as nucleotide sequences, vectors, transformed host cells, and methods of using the humanised antibody to treat, prevent, alleviate, reverse or otherwise amellorate symptoms and/or pathology associated with Down's syndrome, (pre-)clinical Alzheimer's disease or (pre-)clinical cerebral amyloid angiopathy, and to inhibit formation or reduce Abeta plaque in the brain. (Updated on 23-OCT-2003 to standardise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     "light chain variable region, claimed in Claim 4"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New humanized 10D5 antibody, useful for the manufacture of a medicament for treating Down's syndrome, clinical or pre-clinical Alzheimer's disease or cerebral amyloid anglopathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /label= Mature_protein

                                                                                                                                                                                                                                                셤
                              The present sequence is the protein sequence of the heavy chain of a humanised antibody of the present invention. In the variable portion, the complementarity determining regions (CDRs) originate from murine monoclonal antibody 10D5 and the framework region originates from human germline VH segment DP-28 and J segment JH4. Novel humanised antibodies of the invention have CDRs from 10D5 and human framework sequences. These humanised antibodies have binding affinities (affinity and epitope location) approximately the same as those of the mouse 10D5 antibody. The invention includes antibodies, single chain antibodies, and their cargments, as well as nucleotide sequences, vectors, transformed host cells, and methods of using the humanised antibody to treat, prevent, alleviate, reverse or otherwise ameliorate symptoms and/or pathology associated with Down's syndrome, (pre-)clinical Alzheimer's disease or (pre-)clinical Alzheimer's disease or (pre-)clinical Alzheimer's disease or ceduce Abeta plaque in the brain. (Updated on 23-OCT-2003 to standardise
                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is the protein sequence for the heavy chain variable region (VH) of M130, a murine monoclonal antibody (MAb) that binds to Staphylococcus aureus but not to Staphylococcus haemolyticus or Staphylococcus epidermidis. M130 is produced by hybridoma 11-232.3 IE9 (ATCC PTA-3659), which was obtained by immunising mice with UV-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New medicament comprising at least one MAb that binds to peptidoglycan (PepG) of gram-positive bacteria, useful for treating staphylococcal infections, including nosocomial infections.

inactivated whole S. aureus and subcloning by limiting dilution. It is an example of Mabs of the invention that bind to the peptidoglycan of Grampositive bacteria, and which are useful for treating staphylococcus infections. The antibodies also bind to whole bacteria and enhance phagocytosis and killing of the bacteria in vitro and block nasal colonisation by Grampositive bacteria in vitro and block nasal that have been cloned and human/mouse chimeric antibodies were produced that have the MI30 variable regions and human constant regions. These chimeric antibodies, referred to as Al30, retain the ability to bind to S. aureus peptidoglycan, and are expected to have a reduced human antimouse antibody response in humans

The invention relates to humanized immunoglobulin (Ig) light or heavy chains comprising variable region complementary determining regions (CDRs) from the 1284 Ig variable region sequence and variable framework regions from the light or heavy chain or heavy chain or heavy chain sequence. The humanized Ig light or heavy chain or its nucleic acid molecule is useful for preventing or treating an amyloidogenic disease in humans, associated with amyloid deposits of Abeta in the brain, e.g., Alzheimer's disease, Down's syndrome or mild cognitive impairment, all characterized by cognitive impairment. The variable region sequence is useful in producing a three-dimensional image of a 1284 Ig, 1284 Ig chain or its domain. A humanized antibody is useful for reducing plaque or neuritic burden in a subject. The present sequence represents a mouse 1284 antibody variable heavy chain mature peptide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to humanized immunoglobulin (Ig) light or heavy chains comprishing variable region complementary determining regions (CDRs) from the 12B4 Ig variable region sequence and variable framework regions from a human acceptor Ig light chain or heavy chain sequence. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           framework regions,
                                             comprising variable
ole framework regions,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New humanized immunoglobulin light or heavy chains comprising variable region complementary determining regions and variable framework regions useful for preventing or treating e.g., Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Immunoglobulin; Ig; neuroprotective; nootropic; gene therapy; vaccine;
amyloidogenic disease; antibody; 12B4v1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ઠે
                                                                                                                                                                                                                                                                                                                                                               The present sequence is that of a preferred heavy chain variable region of a humanised antibody of the present invention. In this sequence, the complementarity determining regions (CDRs) originate from murine monoclonal antibody 10D5 and the framework region originates from human germline VH segment DP-28 and J segment JH4. Novel humanised antibodies of the invention have CDRs from 10D5 and human framework sequences. These humanised antibodies have binding affinities (affinity and epitope location) approximately the same as those of the mouse 10D5 antibody. The invention includes antibodies, single chain antibodies, and their fragments, as well as nucleotide sequences, vectors, transformed host cells, and methods of using the humanised antibody to treat, prevent, alleviate, reverse or otherwise ameliorate symptoms and/or pathology cassociated with Down's syndrome, (pre-)clinical Alzheimer's disease or (pre-)clinical Alzheimer's disease or (pre-)clinical Alzheimer's disease or category (pre-)clinical Alzheimer's disease or (pre-)clinical cerebral anyloid anglopathy, and to inhibit formation or case and control of the commentation or case and control of the commentation or case and control of the case and case and control of the case and control of the case and case an

The invention relates to humanized immunoglobulin (Ig) light or heavy chains comprising variable region complementary determining regions (CDRS) from the 12B4 Ig variable region sequence and variable framework regions from a human acceptor Ig light chain or neavy chain sequence. The humanized Ig light or heavy chain or its nucleic acid molecule is useful for preventing or treating an amyloidogenic disease in humans, associated with amyloid deposits of Abeta in the brain, e.g., Alzhelmer's disease, bown's syndrome or mild cognitive impairment, all characterized by cognitive impairment. The variable region sequence is useful in producing a three-dimensional image of a 1284 Ig, 12B4 Ig chain or its domain. A humanized antibody is useful for reducing plaque or neuritic burden in a subject. The present sequence represents the humanised 1284WHV1 sequence
                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to humanized immunoglobulin (Ig) light or heavy chains comprising variable region complementary determining regions (CDRs) from the 1284 Ig variable region sequence and variable framework regions from a human acceptor Ig light chain or heavy chain sequence. The humanized Ig light or heavy chain or its nucleic acid molecule is useful for preventing or treating an amyloidogenic disease in humans, associated with amyloid deposits of Abeta in the brain, e.g., Alzheimer's disease, bown's syndrome or mild cognitive impairment, all characterized by a three-dimensional image of a 1284 Ig, 1284 Ig chain or its domain. A humanized antibody is useful for reducing plaque or neuritic burden in a subject. The present sequence represents a mouse 1284 antibody variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New humanized immunoglobulin light or heavy chains comprising variable region complementary determining regions and variable framework regions, useful for preventing or treating e.g., Alzheimer's disease.
                                                                                                                                                                                                                                           Immunoglobulin; Ig; neuroprotective; nootropic; gene therapy; vaccine; amyloidogenic disease; antibody.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to humanized immunoglobulin (Ig) light or heavy chains comprising variable region complementary determining regions (CDRs) from the 12B4 Ig variable region sequence and variable framework regions from a human acceptor Ig light chain or heavy chain sequence. The humanized Ig light or heavy chain or its nucleic acid molecule is useful for preventing or treating an amyloidogenic disease in humans, associated with amyloid deposits of Abeta in the brain, e.g., Alzheimer's disease, Down's syndrome or mild cognitive impairment, all characterized by a three-dimensional image of a 12B4 Ig, 12B4 Ig chain or its domain. A humanized antibody is useful for reducing plaque or neuritic burden in a subject. The present sequence represents a chimeric 12B4VH region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New humanized immunoglobulin light or heavy chains comprising variable region complementary determining regions and variable framework regions, useful for preventing or treating e.g., Alzheimer's disease.
                                                                                                                                                                                                                              Immunoglobulin, Ig; neuroprotective; nootropic; gene therapy; vaccine; amyloidogenic disease; antibody; 12B4; chimeric.

The antibody has the ability to neutralise human immunodeficiency virus. The antibody is classified as IgG kappa and has the sequence RIGFGR or RVGPGR in the principal neutralising domain. The antibody may be used to neutralise the clinically separate strains which cannot be neitralised by the neutralising antibodies against IIIB and IIIMN strains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           naked binding material; short consensus complement receptor; SCR1; SCR2; cancer; Cytostatic; CD55.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Recombinant anti-HIV monoclonal antibody - capable of neutralising strains which can not be neutralised by anti-IIIB and IIIMN antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CDR sequence 2 for the heavy chain of 105AD7 anti-idiotypic antibody.

The sequences given in AAR54101-02 represent the heavy and light chains respectively of the humanised monoclonal antibody (WAb) of the invention. The antibody has the ability to neutralise human immunodeficiency virus. The antibody is classified as IgG kappa and has the sequence RIGPGR or RVGPGR in the principal neutralising domain. The antibody may be used to the neutralise the clinically separate strains which cannot be neitralised by the neutralising antibodies against IIIB and IIIMN strains. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequences given in AAR54103-11 are fragments of the heavy and light chains of the humanised monoclonal antibody (MAb) of the invention.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a naked binding material which binds to both short consensus complement receptor (SCR1) and SCR2 and/or an active both short consensus complement receptor (SCR1) and SCR2 and/or an active agent as a combined preparation for simultaneous, separate or sequential use in the treatment of cancer. The material and the nucleic acid encoding the material are useful in the preparation of a medicament for the neutralization of CDS5, for the enhancement of complement deposition on a tissue, and for treating cancer, which involve administering the material to the subject, which is ammal. The cancer is one or more of colorectal, breast, ovarian, cervical, gastric, lung, liver, skin and material to the presence of inhe material is useful for identifying an agent capable of inhibiting CDS5, which involve bringing into contact a candidate agent with at least a portion of SCR1 and SCR2 of CDS5, and determining the extent to which the candidate agent in the absence of the material bods of the deposition on a cell sample to the material to SCR1 and SCR2 of CDS5, and determining the amount of complement deposition on a cell sample of in the presence and absence of the candidate agent. Which bind both SCR1 and SCR2 of CDS5, and/or determining the amount of complement deposition on a cell sample of the assay method is useful in the manufacture of a medicament for the treatment of cancer. The presence expresents a CDR sequence for the heavy chain of 105AD7 anti-idiotypic antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

A peptide derived from this antibody contains the 105AD7 heavy chain variable region and a 105AD7 kappa chain. The complementarity determining regions (CDR) of this peptide and its fragments can stimulate immune responses. The peptide can be used for screening for its functional equivalents and mimetics. The peptides, and
 antibody has the ability to neutralise human immunodeficiency virus. The antibody is classified as IgG kappa and has the sequence RIGPGR or RVGPGR in the principal neutralising domain. The antibody may be used to neutralise the clinically separate strains which cannot be neitralised by the neutralising antibodies against IIIB and IIIMN strains
                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acid encoding peptide derived from antibody 105AD7 - used to induce an immune response for treatment and prevention of cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAQ70612 codes for human interleukin-6 binding inhibitor, the polypeptide described in AAR58612. This polypeptide ihibits the binding of human IL-6 to its receptor, and can therefore be useful in the treatment of a variety of autoimmune diseases; specifically in the treatment of rheumatoid arthritis, septic shock due to bacterial infection and multiple myeloma. (Updated on 25-MAR-2003 to correct PN field.)
the fragments, equivalents and mimetics are used to stimulate an immune response to a tumour antigen, for the treatment or prevention of tumours. Transfected host cells are used to produce this peptide and the vectors can be used to generate the peptide in vivo for stimulation of an immune response. The peptide contains promiscuous helper epitopse which stimulate a response against tumour antigens other than gp72. These epitopes may help a cytotoxic T lymphocyte response to any co-injected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polypeptide inhibiting binding of human interleukin-6 (IL-6) to its receptor - useful for treating auto:immune disease induced or aggravated
